

Azure Deployment Summary

Region Selection

I selected South Africa North (Johannesburg) as my deployment region because:

- It provides low-latency services for Southern African users.
- It ensures compliance with local data residency laws (e.g., POPIA).
- It supports a broad portfolio of Azure services including compute, storage, networking, and AI workloads.

Resource Group

I created a resource group named **ASHA-a** under my subscription **Azure subscription 1**.

This resource group acts as a logical container for future deployments.

Shared Responsibility Model

For the Virtual Machine deployed in South Africa North:

1. **Microsoft's Role:** Protects the underlying infrastructure, physical environment, and core platform services.
2. **My Role as Customer:**
 - Configure secure authentication and authorization.
 - Apply governance policies for data handling.
 - Monitor workloads and respond to application-level threats.

This division ensures that while Microsoft secures the platform, I remain responsible for the configuration and security of my own workloads.

Cost Management

I accessed the **Cost Management + Billing** section to explore tools for setting up budgets and usage alerts. This helps me remain within the Free Tier limits and monitor spending effectively.
